

Open Street Maps

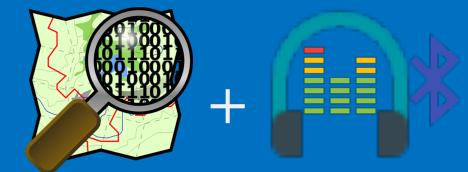

Brightening the world for the blind using spatial audio

ERIK SCHLEGEL

@erikschlegel1

<https://github.com/erikschlegel>

A little about me

Open Source Enthusiast and Data Geek.

Mapping Hobbyist.

Senior Engineer @ Microsoft in New York City.

Backend Architect for the Guide Dogs Project.

Early Contributor to the UWP React Native Platform.

- What is Openstreet Map, really?

A PostgresSQL database often referred to as the wikipedia of spatial data.

A free, editable, open map of the world.

Tile caching server.

Crowdsourced dataset, made entirely by voluntary efforts of the online masses.

Basically, unrestricted use and no data approval body.

Built by the community in the open.

What is Openstreetmap

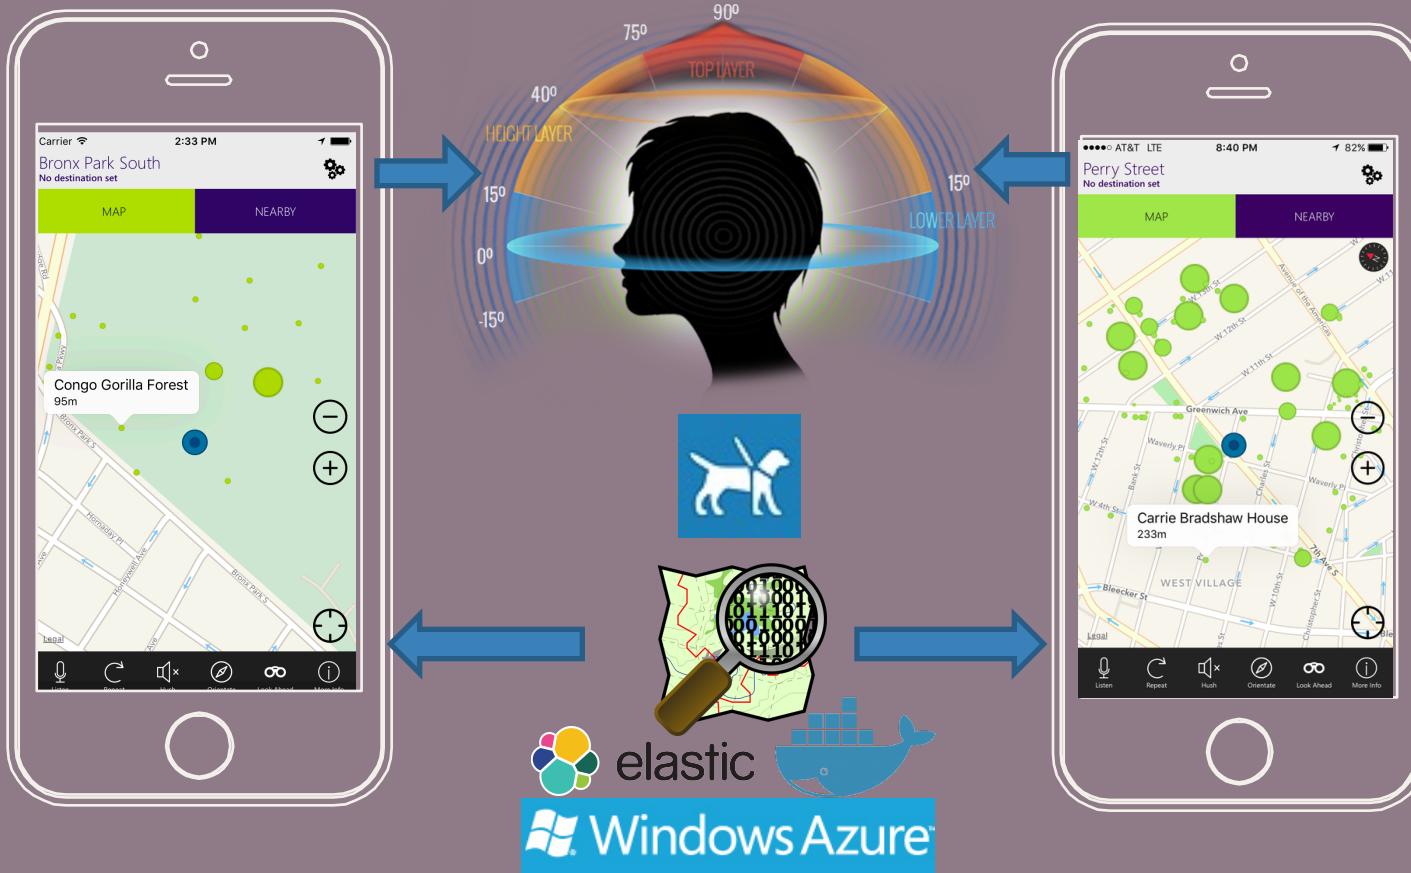

An OSM map targeted for the Melbourne Hipster community. 🍀

hipstermelbourne.org

What Is Guide Dogs

- Rendering a world with sound, powered by Open Street Maps.
- Empowering blind users to explore a city using 3D audio to improve independent mobility.

What can I use OSM for?

Determining nearby points of interest

Rendering custom map tiles(*i.e. heatmaps*)

Geocoding(*i.e. Where Am I / Where is this*)

Turn-by-Turn Navigation

Advanced Mapping Websites

Offline mapping and smartphone access

Realtime mass transit updates

Local Search

Pretty much anything

Who Uses OSM?

Foursquare

Apple

Github

Road Trippers

Mapbox

Mapquest

FLICKR

and many more.

Show me the data

Flexible Data Schema – Arbitrary Attributes. 3 main primitives

```
<node id="4045616048" visible="true" version="":

Data Extraction

Overpass API – 3rd party REST based service provider for retrieving OSM data.
Offers a powerful query language off OSM.

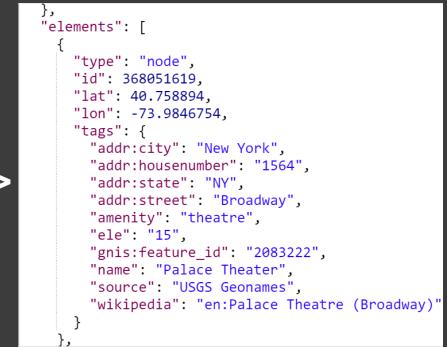

REQUEST->

A screenshot of a Postman interface. The method is set to POST, and the URL is http://www.overpass-api.de/api/interpreter. The 'Body' tab is selected, showing an Overpass query in JSON format. The query retrieves nodes with names near a theatre in New York City, specifically around Broadway and 350th Street.

```
[{"out": "json"}, {"1": "(node['name'])(around:350,40.758895,-73.985131);", "2": "2: node['amenity'~'theatre']();", "3": "3: ->.result_set;out;", "4": "4: ( way['name']());", "5": "5: ->.result_set;out;"}]
```

RESPONSE->

A screenshot of a Postman response showing the extracted OSM data in JSON format. The data represents a node for the Palace Theater in New York City, with its coordinates, tags (amenity:theatre, ele:15), and various identifiers.

```
{
  "elements": [
    {
      "type": "node",
      "id": 368051619,
      "lat": 40.758894,
      "lon": -73.9846754,
      "tags": {
        "addr:city": "New York",
        "addr:housenumber": "1564",
        "addr:state": "NY",
        "addr:street": "Broadway",
        "amenity": "theatre",
        "ele": "15",
        "gnis:feature_id": "2083222",
        "name": "Palace Theater",
        "source": "USGS Geonames",
        "wikipedia": "en:Palace Theatre (Broadway)"
      }
    }
  ]
}
```

Planet Files – All OSM data in a single file.

Osmosis – A CLI that imports / exports planet files to / from a DB. Also compares planet files and creates changesets

```
//import all speed_cameras in the world into a Postgres DB
osmosis --read-pbf theworld.osm.pbf --node-key-value keyValueList="highway.speed_camera" --log-progress --write-pgsql database=pgsnapshot
```

Demo: Custom Tiles

Custom tile rendering frameworks TileMill and Mapzents Tangram WebGL.

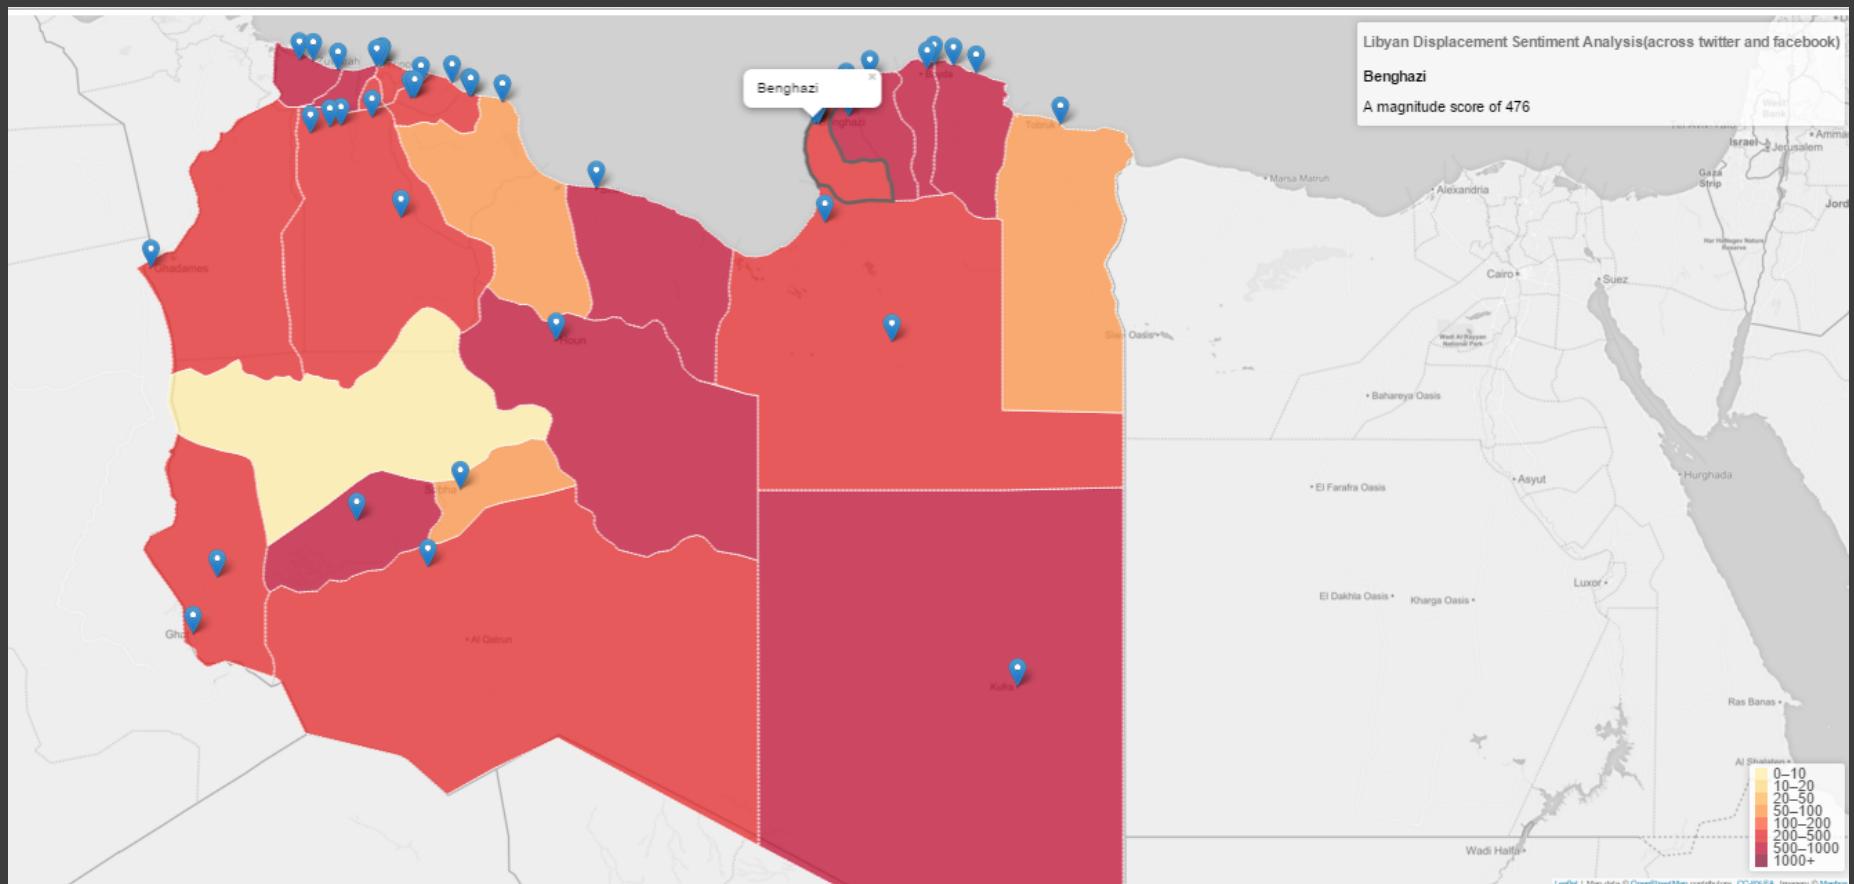

1. Gotham Tangram Scene

2. Tron Tangram Scene

Demo: HeatMaps using Leaflet and OSM

Demo: A heatmap representing sentiment magnitude levels of displaced Libyan citizens over the last month, by region.

Boundaries are sourced from OSM, filtered on bounding view via TurfJS.

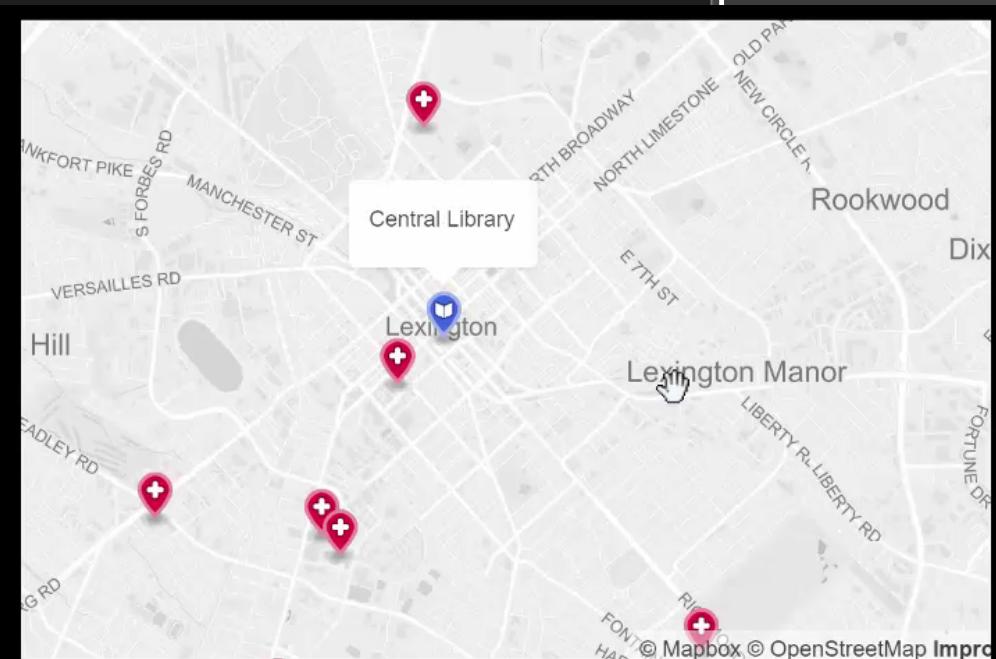

Demo: Geospatial Analysis Tools

Enter TurfJS – Geospatial-based JS framework that speaks GEOJSON.

```
var libraries = {  
  "type": "FeatureCollection",  
  "features": [  
    { "type": "Feature", "properties": { "Name": "Village Branch", "Address": "2185 Versailles Rd" }, "geometry": { "type": "Point", "coordinates": [-84.5, 38.05] } },  
    { "type": "Feature", "properties": { "Name": "Northside Branch", "ADDRESS": "1733 Russell Cave Rd" }, "geometry": { "type": "Point", "coordinates": [-84.5, 38.05] } },  
    { "type": "Feature", "properties": { "Name": "Central Library", "ADDRESS": "140 E Main St" }, "geometry": { "type": "Point", "coordinates": [-84.5, 38.05] } },  
    { "type": "Feature", "properties": { "Name": "Beaumont Branch", "Address": "3080 Fieldstone Way" }, "geometry": { "type": "Point", "coordinates": [-84.5, 38.05] } },  
    { "type": "Feature", "properties": { "Name": "Tates Creek Branch", "Address": "3628 Walden Dr" }, "geometry": { "type": "Point", "coordinates": [-84.5, 38.05] } },  
    { "type": "Feature", "properties": { "Name": "Eagle Creek Branch", "Address": "101 N Eagle Creek Dr" }, "geometry": { "type": "Point", "coordinates": [-84.5, 38.05] } }  
  ]  
};
```

```
var map = L.mapbox.map('map', 'mapbox.light')  
.setView([38.05, -84.5], 12);  
map.scrollWheelZoom.disable();  
  
var hospitalLayer = L.mapbox.featureLayer(hospitals)  
.addTo(map);  
var libraryLayer = L.mapbox.featureLayer(libraries)  
.addTo(map);  
  
// When a library is clicked, do the following  
libraryLayer.on('click', function (e) {  
  // Reset any and all marker sizes to small  
  reset();  
  // Get the GeoJSON from libraryFeatures and hospitalFeatures  
  var libraryFeatures = libraryLayer.getGeoJSON();  
  var hospitalFeatures = hospitalLayer.getGeoJSON();  
  // Using Turf, find the nearest hospital to library clicked  
  var nearestHospital = turf.nearest(e.layer.feature, hospitalFeatures);  
});
```

Data Accuracy Oversight

TOOLS OSMLint, Osmose, Keep Right, Tile Reduce, Map Roulette, JOSM Validator and OSM-QA-Tiles

Growing number of OSM error detection tools to flag mapping errors.

Mapbox has an operations team that monitor / resolve OSM breaks.

Automated comparison models are reconciling OSM against Google Maps, TIGR, Bing aerial imagery and many other sources.

Version Control

All OSM changes are time machined by user. The State of the Map can be re-played from any given time (“*Attic Data*”).

```
overpass.osm.rambler.ru/cgi/interpreter?data=[bbox][date:"2012-09-12"];node[amenity=post_box];out;&bbox=7.0,50.6,7.3,5]
```

OSM changes can be exported by date range for a given area.

One can compare OSM spatial changes / trends over time.

```
overpass.osm.rambler.ru/cgi/interpreter?data=[bbox][diff:"2012-09-14","2012-09-21"];node[amenity=post_box];out;&bbox=7.0,50.6,7.3,50.8
```

OSM Accessibility

One of the key OSM selling points for the Guide Dogs project was how accessible the data is for users that are deaf and/or blind.

Accessibility Tags Guide Dogs uses for Navigation

entrance=yes (the entrance of a way / park)

blind:description:en=(callout text for blind users) Warning: Dangerous automatic door turning anticlockwise.

tactile_paving=incorrect

wheelchair=limited

kerb= lowered or raised(predefined curb type). Kerb:height is also tracked

highway=steps (for escalators) or footway (for moving walkways)

conveying=incline or decline for escalator direction

footway=sidewalk

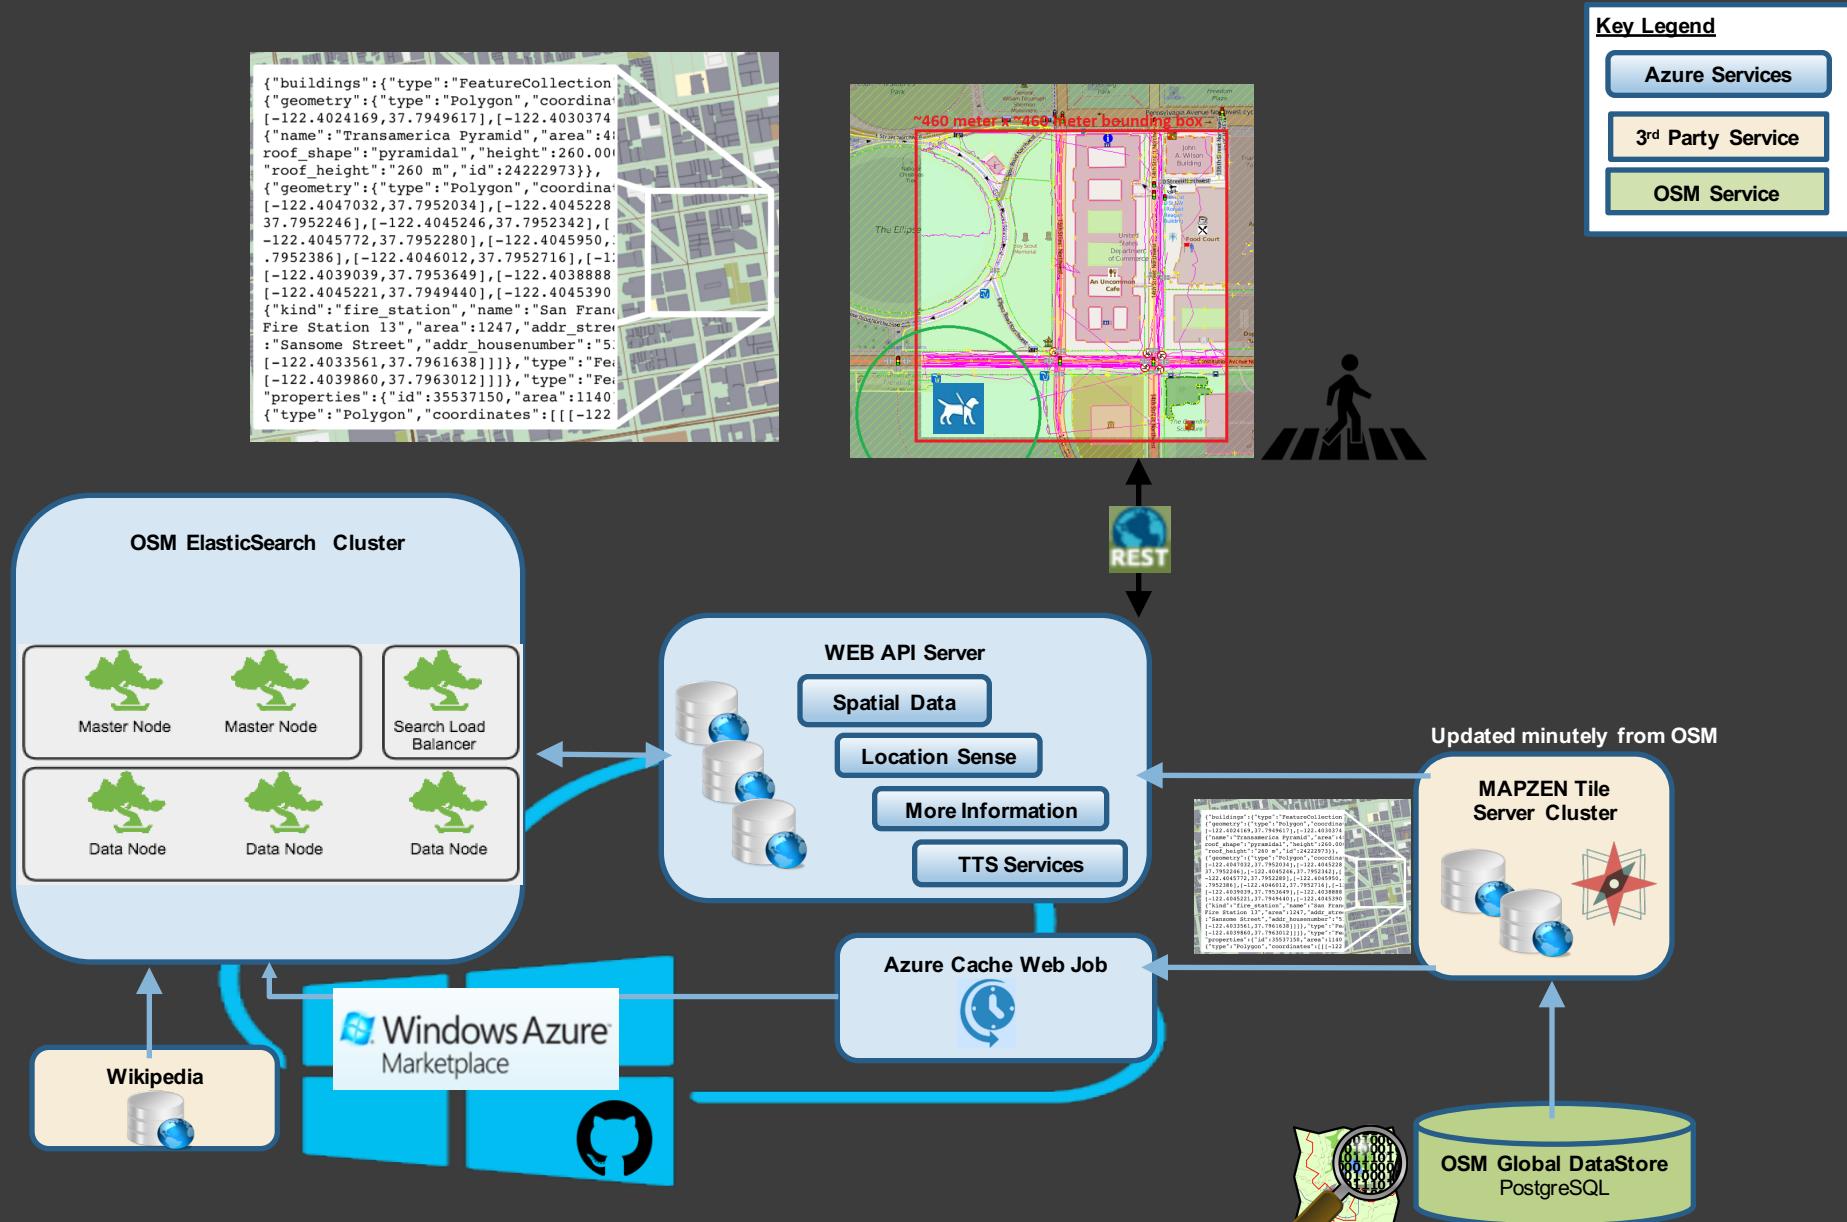

surface=* (defines paving).

access= (legal access restrictions) yes or no or private

crossing=*(defines the restrictions of the pedestrian crossing)

lit=*(indicates the presence of lighting)

Guide Dogs – a tile based system

Demo: Near-Realtime Performance

Content rendering is based on user movement and heading changes.

Responsiveness and availability of OSM data had to be near realtime.

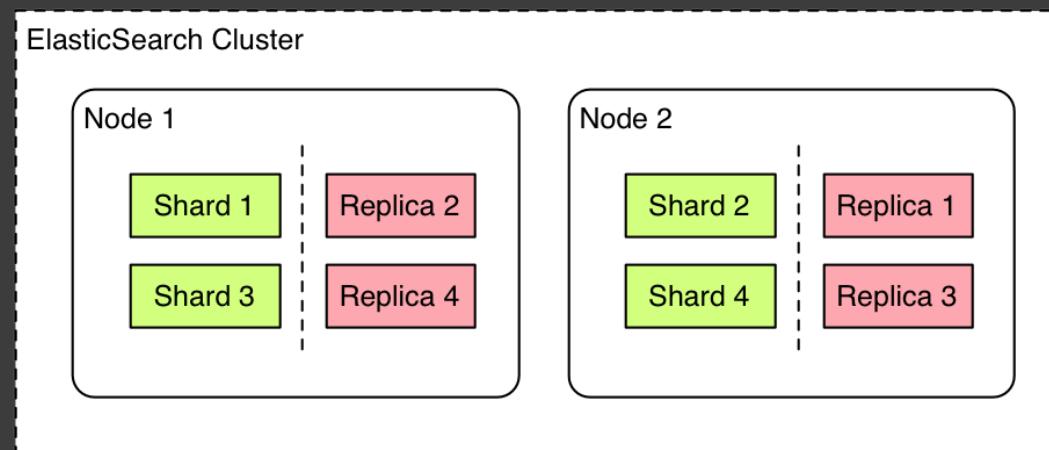

Support for handling complex geo shapes that's fault tolerant and load balanced.

Powered by Azure and Elasticsearch NEST .NET Client.

Tile data provided by OSM and Mapzen.

Utilize OSM changeset info to only update tiles that were recently changed.

Elastic Architecture Concept

Elastic Search NEST Client

Bulk Indexing Documents

```
var descriptor = new BulkDescriptor();
var coord1 = new double[][][] { new double[][] { new double[] { 40.73659338, -74.0008906 }, new double[] { 40.73659339 } }
descriptor.Index<Place>(op => op.Document(new Place()
{
    amenity = "restaurant",
    cuisine = "american",
    name = "Bluestone",
    Id = "232323223",
    type = "node",
    coordinates = new Coordinates() { type = "multilinestring", coordinates = coord1 }
})
.Index("places"));

descriptor.Index<Place>(op => op.Document(new Place()
{
    amenity = "restaurant",
    cuisine = "italian",
    name = "Starbucks",
    Id = "232323221",
    type = "node",
    location = new Location() { lat = 40.73659338, lon = -74.0008906 }
})
.Index("places"));

var test = await ElasticManager.Instance.BulkOperationAsync(descriptor);
```

Geo Shape Intersection Search

```
#nullable enable
var bbox = new BoundingBox.Builder().Build(location, meterDistance, DistanceType.Meters);

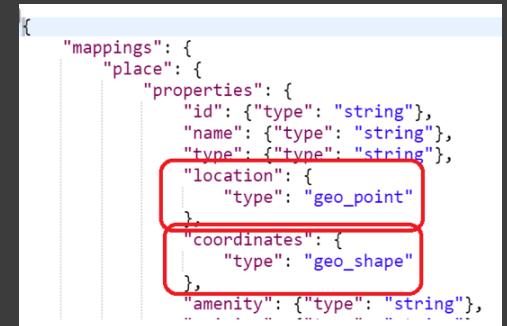

return await Connection.SearchAsync<Place>(search => search.Size(2000)
    .Query(f => f.Bool(b =>
    {
        var filters = new List<Func<QueryContainerDescriptor<Place>, QueryContainer>>();

        filters.Add(filter => filter
            .GeoBoundingBox(bb => bb.Field(bf => bf.location)
                .BoundingBox(bbox.maxMapPoint.Latitude, bbox.minMapPoint.Longitude,
                            bbox.minMapPoint.Latitude, bbox.maxMapPoint.Longitude)));

        filters.Add(filter => filter.GeoShapeEnvelope(box => box
            .Field(p => p.coordinates)
            .Coordinates(new List<Nest.GeoCoordinate>() { new Nest.GeoCoordinate(bbox.minMapPoint.Longitude,
                            bbox.minMapPoint.Latitude),
                new Nest.GeoCoordinate(bbox.maxMapPoint.Longitude, bbox.maxMapPoint.Latitude) })));

        return b.Should(filters);
    }));
}
```

Elastic POI Index

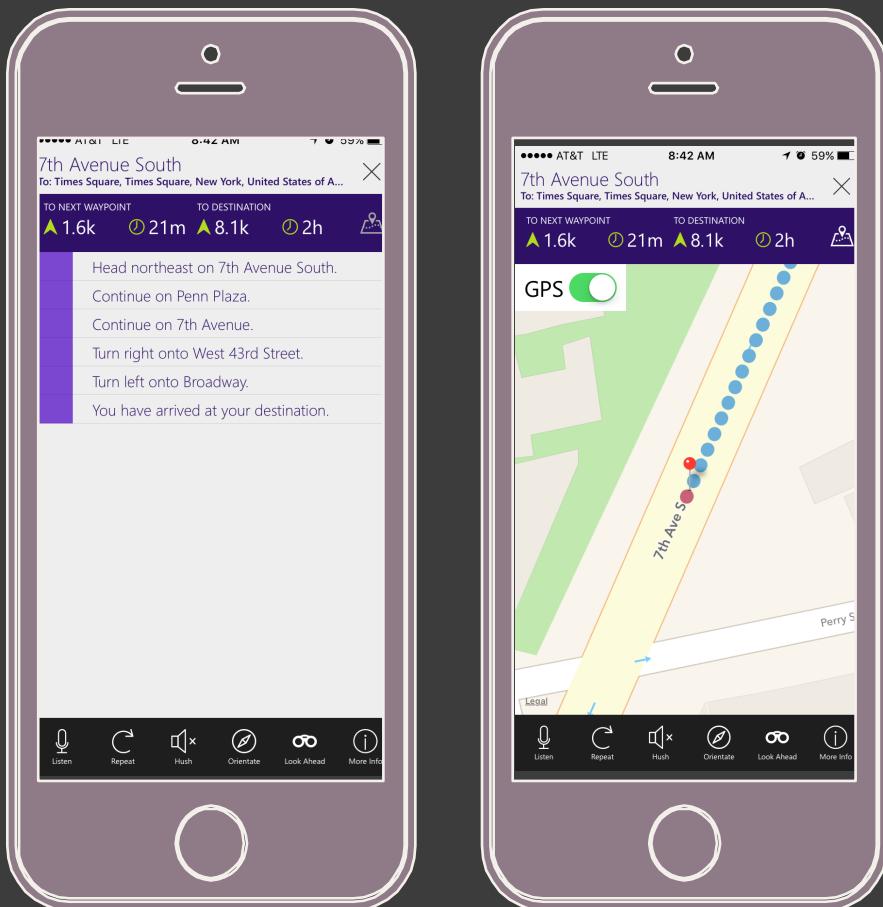

```
{
    "mappings": {
        "place": {
            "properties": {
                "id": {"type": "string"},
                "name": {"type": "string"},
                "type": {"type": "string"},
                "location": {
                    "type": "geo_point"
                },
                "coordinates": {
                    "type": "geo_shape"
                },
                "amenity": {"type": "string"}
            }
        }
    }
}
```

Turn-By-Turn Navigation

Mapzen has an open source turn-by-turn routing engine working off OSM.

Pedestrian route costing model that increases weighting on routes with foot paths, sidewalks, pedestrian access and entrances. Steps, stairs and alleys are slightly avoided.

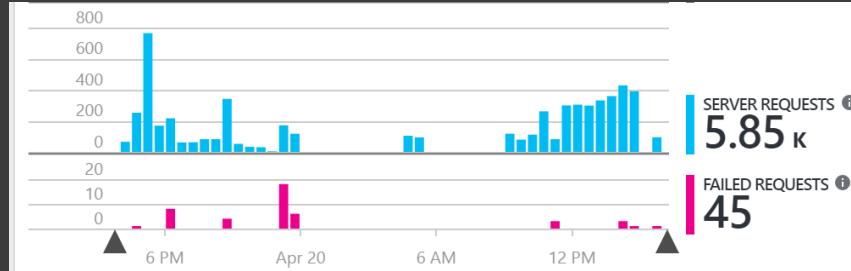

RESPONSE

```
"endPathIndices": [  
  4  
,  
  "startPathIndices": [  
  2  
,

  "rough": false  
}  
,  
  "instruction": {  
    "formattedText": null,  
    "text": "Turn left onto Greenwich Avenue.",  
    "verbal_pre_transition_instruction": "Turn left onto Greenwich Avenue.",  
    "verbal_post_transition_instruction": "Continue for 90 meters.",  
    "verbal_transition_alert_instruction": "Turn left onto Greenwich Avenue."  
},  
  "sideOfStreet": right,  
  "travelDistance": 0.0860000029206276,  
  "travelDuration": 63
```

Production Quality Oversight

Application Insights - monitor and measure service performance and exceptions.

Web Tests - benchmark microservice(s) performance tests with alert escalation.

The dashboard displays web test results and alert configuration. On the left, the 'Web tests' section shows a chart of response times (ms) from 0 to 2s, with a total of 1005 successful tests and 0 failed tests. It also shows an average response time of 1.06 sec. Below this, a table lists 'All web tests' with two entries: OSMCachePerf and Oxford TTS Response Tolerance, both at 100% success across all time intervals (20 min, 1 h, 24 h, 72 h).

The right side of the dashboard is the 'Edit test' section for a specific test. It includes fields for 'Select a file', 'Test frequency' (set to 5 minutes), 'Test locations' (1 location(s) configured), 'Success criteria' (Criteria specified in test file), and 'Alerts'. The 'Alerts' section is expanded, showing an alert for 'Alert if 1/1 locations fails in 5 min...'. The 'Alerts' section also includes options for enabling/disabling alerts, setting alert locations threshold (1), and specifying alert failure time window (5 minutes). It also shows checkboxes for sending alert emails to subscription admins and specific email addresses (dogsservice@microsoft.com), and a 'Webhook' section with a link to learn more about configuring webhooks.

Why OSM as opposed to other map providers

~20 minute update schedule for propagating data changes.

A flexible data model where new tags / fields are well supported.

Availability of accessibility data in OSM.

Data is free, accurate and open source.

Flexible license.

Open Source tooling around collecting and analyzing OSM data.

Custom tiles.

Supports offline data download and navigation.

Growing community that contribute mapping data to OSM daily.

OSM Challenges

No official data schema standardization.

OSM is subject to contributor biases.

Retrieving OSM data requires more technical skill than getting data in.

Detail and precision across OSM varies from region to region.

No SLA with resolving systematic OSM data quality exception breaks.

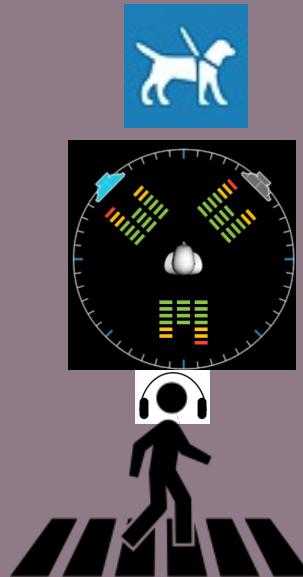

3D Audio / Demo

Microsofts HRTF 3-D audio engine gives OSM spatial data a voice, and enables users to build a mental map of the area.

Spatial sound cues are used for navigation, points of interest and journey details alongside regular GPS instructions.

Cortana TTS services are used to translate text results to an audio stream.

Guide Dogs uses sound event notifications to help drive the user experience.

Thank You

ERIK SCHLEGEL
